

Session Summary 1: Coal Mine Scenario Discussion

In this session, we were given a situation involving a coal mine where a blast occurred, causing water from a nearby river to flood into the mine. Everyone managed to escape except for the mine owner, a child who was secretly brought inside by his father, a government officer with asthma, and a scientist working on a new formula for unlimited energy supply. Sir divided us into groups and asked us to come to a conclusion about who should be saved first. After 30 minutes, sir asked our team leader to write our conclusion on the board, and then the group discussion began. Many new ideas and reasons were presented by the students, which broadened our perspective on the situation.
